The structure of Frobenius nilHecke algebras

John Stuart

1. Introduction

The purpose of this paper is to supplement [SS20] by Savage and Stuart, which focuses on similar results through the lens of strict monoidal categories. The string diagram approach in [SS20] can be more intuitive for experienced readers, but the different notation often acts as a barrier to those new to the subject. For this reason, we avoid the language of strict monoidal categories, and give a purely algebraic treatment of the subject. Also, several of the omitted proofs in [SS20] can be found in this paper.

One of the earliest appearances of the nilHecke ring was in [KK86] by Kostant and Kumar, and was used to unify different algebraic structures. The name came from its resemblance with the Hecke algebra, differing by a modification to the braid relation so that the generator squares to zero. The nilHecke algebra also shows up as the simplest case of the quiver Hecke algebra categorifying quantum groups. Most readers will recognize the nilHecke algebra as the algebra of divided difference operators on a polynomial ring.

In this paper, we define a Frobenius nilHecke algebra, which is a further modification to the Hecke algebra. As with the original, our algebra depends on a given nilHecke algebra as the algebra of divided difference operators on a polynomial ring. As the simplest case of the quiver Hecke algebra categorifying quantum groups. Most readers will recognize the nilHecke algebra as the algebra of divided difference operators on a polynomial ring.

Our algebra nilHecke is a semi-simple superalgebra that is Morita equivalent to the odd nilHecke algebra in [EKL14] by Ellis-Khovanov-Lauda. With different choices of Frobenius algebras, we can obtain known algebras in the literature, for example we obtain a Frobenius nilCoxeter algebra in Definition 3.1. Notice that the subalgebra generated by the $a$’s and $x$’s is the nilCoxeter algebra, nilCox. Next the Frobenius nilCoxeter algebra nilCox$_n(A)$ is the subalgebra generated by the $a$’s and $x$’s and $A \in A^{\otimes n}$, and the Frobenius polynomial algebra Pol$_n(A)$ is the subalgebra generated by the $x$’s and $a \in A^{\otimes n}$. Our algebra nilHecke$_n(A)$ is similar to the affine wreath product algebra described by Savage in [Sav18]. The main difference between nilHecke$_n(A)$ and Savage’s affine wreath product algebra is that $u_i^2 = 0$ in nilHecke$_n(A)$, whereas $s_i^2 = 1$ in Savage’s paper.

After defining nilHecke$_n(A)$ and describing some basic results, we show that in the special case of taking $A$ to be the Clifford superalgebra $Cl$, then we get two Morita equivalences. First, nilHecke$_n(Cl)$ is Morita equivalent to the odd nilHecke algebra studied in [EKL14] by Ellis-Khovanov-Lauda. Second, we get another Morita equivalence of the nilCoxeter algebra and the odd nilCoxeter ring, also studied in [EKL14]. This first result is analogous to Theorem 4.1 in [Wan09], where Wang establishes an isomorphism between the affine Sergeev algebra and the Clifford algebra tensored with the degenerate spin affine Hecke algebra. The second result is analogous to the well-known Morita equivalence between the Sergeev algebra and the spin symmetric group algebra that can be found in Lemma 13.2.3 of [Kle05] by Kleshchev. Below, we have our results on the left compared with Wang’s on the bottom right, and Kleshchev’s on the top right:

\[
\begin{align*}
\text{Cl}^{\otimes n} \otimes \text{ONC}_n & \xrightarrow{\sim} \text{nilCox}_n(\text{Cl}) & \text{Cl}^{\otimes n} \otimes \text{CS}_n^- & \xrightarrow{\sim} \text{Cl}^{\otimes n} \otimes \text{CS}_n \\
\text{Cl}^{\otimes n} \otimes \text{ONH}_n & \xrightarrow{\sim} \text{nilHecke}_n(\text{Cl}) & \text{Cl}^{\otimes n} \otimes \mathfrak{f}_s^- & \xrightarrow{\sim} \mathfrak{f}_s^c
\end{align*}
\]

These isomorphisms give Morita equivalences since $Cl$ is a semi-simple superalgebra.
Finally, we show how the generators $u_i$ of nilCox$_n$ can act on $\text{Pol}_n(A)$ as Demazure operators, and that they satisfy all of the relations in nilHecke$_n(A)$, where $f \in \text{Pol}_n(A) \subset \text{nilHecke}_n(A)$ act by left multiplication. This allows us to define a faithful action nilHecke$_n(A) \to \text{End}(\text{Pol}_n(A) \otimes \text{nilCox}_n)$ from which we deduce a basis theorem for nilHecke$_n(A)$. Afterwards, we also deduce a basis of the subalgebra nilCox$_n(A)$. In certain special cases, we are able to give explicit equations for the Demazure operator, which is originally defined inductively.

**Acknowledgements.** This research of J. Stuart was supported by Discovery Grant RGPIN-2017-03854 from the Natural Sciences and Engineering Research Council of Canada (NSERC). The project was completed as part of an NSERC Undergraduate Student Research Award under the supervision of A. Savage.

## 2. Basics of Frobenius superalgebras

We start by introducing Frobenius superalgebras and proving some basic facts about them.

**Definition 2.1** (Superalgebra). A superalgebra $A$ is an algebra $A$ that has a decomposition $A = A_0 \oplus A_1$ such that $A_i A_j \subseteq A_{i+j}$ for $i,j \in \mathbb{Z}_2$. When $a \in A_0$, we say that $a$ is even and we write $\bar{a} = 0 \in \mathbb{Z}_2$. Similarly, if $a \in A_1$, we say that $a$ is odd and we write $\bar{a} = 1 \in \mathbb{Z}_2$.

**Definition 2.2** (Frobenius superalgebra). A Frobenius superalgebra is a pair $(A, \text{tr})$ such that $A$ is a finite dimensional superalgebra over a field $k$ and $\text{tr} : A \to k$ is a linear map such that for any nonzero $a \in A$, there exists $b \in A$ for which $\text{tr}(ab) \neq 0$. The parity of the trace $\text{tr}$ is even ($\varepsilon = 0$) if it is parity preserving (viewing $k$ as even) and odd ($\varepsilon = 1$) if it is parity reversing.

**Remark 2.3.** For every Frobenius superalgebra $(A, \text{tr})$, there exists a Nakayama automorphism $\psi : A \to A$ such that $\text{tr}(ab) = (-1)^{\bar{a}\bar{b}} \text{tr}(b \psi_1(a))$. This follows from Proposition 3.1 in [YS12] by A. Skowroński and K. Yamagata. Even more, if we have two different trace maps $\text{tr}_1$ and $\text{tr}_2$ for the same superalgebra $A$, then by Proposition 3.4 in [PS16] by Pike and Savage, there is an invertible element $v \in A$ such that

$$\text{tr}_2(a) = \text{tr}_1(\bar{a}v) \quad \forall a \in A.$$  

We must have $\bar{v} = \varepsilon_1 + \varepsilon_2$ where $\varepsilon_1, \varepsilon_2$ are the parities of the trace maps. Also, the Nakayama automorphisms satisfy $\psi_2(a) = (-1)^{\bar{a}} \psi_1(a)v^{-1}$ since

$$\text{tr}_2(ab) = \text{tr}_1(\bar{a}v \psi_1(a)) = (-1)^{\bar{b}+\varepsilon_2} \text{tr}_1(b \psi_1(a)) = (-1)^{\bar{b} \bar{a}} \text{tr}_2(b(-1)^{\bar{a}} \psi_1(a)v^{-1}).$$

For the rest of this text, $A$ refers to an $m$-dimensional Frobenius superalgebra over a field $k$.

**Lemma 2.4.** For any basis $\{b_1, \ldots, b_m\}$ of $A$, there exists a unique basis $\{b_1^\vee, \ldots, b_m^\vee\}$ of $A$ such that

$$\text{tr}(b_i^\vee b_j) = \delta_{j,i}.$$  

**Proof.** Fix $k \in \{1, \ldots, n\}$ and let $a_1, \ldots, a_m \in k$. Consider system of equations,

$$\delta_{k,i} = \text{tr}((a_1 b_1 + \cdots + a_m b_m) b_i) = a_1 \text{tr}(b_1 b_i) + \cdots + a_m \text{tr}(b_m b_i), \quad \forall i \in \{1, \ldots, n\}.$$

Solving this system is equivalent to solving $M\bar{a} = e_k$ where $M \in M_m(k)$ with $M_{i,j} = \text{tr}(b_j b_i)$ and $\bar{a} = (a_1, \ldots, a_m)$. This matrix is invertible since any nonzero $\bar{v}$ for which $M \bar{v} = 0$ corresponds to a nonzero element $v \in A$ for which $\text{tr}(\bar{v}b) = 0 \forall b \in A$ contradicting the non-degeneracy of the trace map. Therefore take $b_k^\vee = M^{-1}e_k$. \hfill $\square$

**Proposition 2.5.** For all $a \in A$, we have

$$\sum_{b \in B} \text{tr}(b^\vee a)b = a = \sum_{b \in B} \text{tr}(ab)b^\vee.$$  

**Proof.** We write $a = a_1 b_1 + \cdots + a_m b_m = c_1 b_1^\vee + \cdots + c_m b_m^\vee$ as decompositions in $B$ and its dual basis. This gives us

$$\sum_{i=1}^{m} \text{tr}(b_i^\vee a)b_i = \sum_{i=1}^{m} \text{tr}(b_i^\vee (a_1 b_1 + \cdots + a_m b_m))b_i = \sum_{i=1}^{m} (a_1 \text{tr}(b_i^\vee b_1) + \cdots + a_m \text{tr}(b_i^\vee b_m))b_i = \sum_{i=1}^{m} a_i b_i = a,$$
\[ \sum_{i=1}^{m} \text{tr}(ab_i)b_i^\vee = \sum_{i=1}^{m} \text{tr}((c_1b_i^1 + \cdots + c_mb_m^m)b_i^\vee) = \sum_{i=1}^{m} (c_1 \text{tr}(b_i^1b_i) + \cdots + c_m \text{tr}(b_m^mb_i))b_i^\vee = \sum_{i=1}^{m} c_ib_i^\vee = a. \qed \]

### 3. The Frobenius nilHecke superalgebra

In this section, we'll define our main object of interest: the Frobenius nilHecke superalgebra. We show that although the definition uses both a chosen basis and the trace map of \(A\), the resulting Frobenius nilHecke superalgebra is independent of these choices.

For \(a \in A\) and \(1 \leq i \leq n\), define:

\[ a_i := 1^{\otimes (i-1)} \otimes a \otimes 1^{\otimes (n-i)} \]

\[ \psi_i := \text{id}_A^{\otimes (i-1)} \otimes \psi \otimes \text{id}_A^{\otimes (n-i)} \]

**Definition 3.1.** Define the *Frobenius polynomial algebra* \(\text{Pol}_n(A)\) to be the free product of \(A^{\otimes n}\) with the free associative algebra on generators \(x_1, \ldots, x_n\) modulo the following relations:

\[ x_ix_j = (-1)^{i}\delta_{ij}x_jx_i \]

\[ ax_i = (-1)^{i}aix_i\psi_i(a) \]

where \(1 \leq i, j \leq n, i \neq j, a \in A^{\otimes n}\), \(\psi\) is the Nakayama automorphism, and \(p\) is the parity of the trace. The parities of elements is induced from \(x_i\) being odd and \(a_i\) being the same parity as \(a\) in \(A\). Also, define

\[ \tau_{i,j} := \sum_{b \in B} (-1)^{b}b_ib_j^\vee. \]

Note that multiplication in \(A \otimes A\) is defined as follows:

\[ (a \otimes b)(c \otimes d) = (-1)^{bc}ac \otimes bd \]

**Proposition 3.2.** The element \(\tau_{i,j} \in A^{\otimes n}\) is independent of the basis \(B\).

**Proof.** Let \(B = \{b^{(1)}, \ldots, b^{(m)}\}\) and \(B' = \{c^{(1)}, \ldots, c^{(m)}\}\) be homogeneous bases for \(A\). Then there exist invertible matrices \(M, N \in M_m(k)\) such that \(c^{(i)} = \sum_{j=1}^{m} M_{ij}b^{(j)}\) and \(c^{(j)} = \sum_{j=1}^{m} N_{ij}b^{(j)}\). We have

\[ c^{(i)}c^{(j)} = \left( \sum_{k=1}^{m} N_{ik}b^{(k)\vee} \right) \left( \sum_{l=1}^{m} M_{jl}b^{(l)\vee} \right) = \sum_{k,l=1}^{m} M_{jl}N_{ik}b^{(k)\vee}b^{(l)\vee}. \]

Applying the trace map to both sides, we obtain the following

\[ \delta_{ij} = \text{tr}(c^{(i)\vee}c^{(j)}) = \text{tr} \left( \sum_{k,l=1}^{m} M_{jl}N_{ik}b^{(k)\vee}b^{(l)\vee} \right) = \sum_{k,l=1}^{m} M_{jl}N_{ik} \text{tr}(b^{(k)\vee}b^{(l)\vee}) = \sum_{k=1}^{m} M_{jk}N_{ik} = (MN^T)_{ij}, \]

\[ \implies MN^T = I \implies N^T = M^{-1} \implies N^TM = I \implies M^TN = I, \]

where the last step is obtained by transposition. Since the bases are homogeneous, \(M_{ij}\) is zero when \(c^{(i)}\) and \(b^{(j)}\) have different parities. Thus

\[ \sum_{i,j,k=1}^{m} (-1)^{c_w^{(i)}} c_w^{(i)} c_r^{(j)} = \sum_{i,j,k=1}^{m} M_{ij}N_{ik}(-1)^{\epsilon^{(w)}} b^{(j)}_{w}b^{(k)}_{r} = \sum_{j,k=1}^{m} (M^TN)_{jk}(-1)^{\epsilon^{(w)}} b^{(j)}_{w}b^{(k)}_{r} = \sum_{j=1}^{m} (-1)^{\epsilon^{(w)}} b^{(j)}_{w}b^{(j)}_{r}. \]

**Definition 3.3** (Frobenius nilHecke algebra). Let the *nilCoxeter algebra* \(\text{nilCox}_n\) have even generators \(u_i\) for \(1 \leq i < n\) and the relations

\[ u_i^2 = 0, \]

\[ u_iu_j = u_ju_i \quad \text{if} \quad |i - j| > 1, \]

\[ u_iu_{i+1}u_i = u_{i+1}u_iu_{i+1}, \]
The Frobenius nilHecke algebra nilHecke$_n(A)$ is the quotient of the free product of nilCox$_n$ and Pol$_n(A)$ by relations

\[
au_i = u_i s_i(a),
\]

\[
x_ju_i = u_ix_j \quad \text{if } j \notin \{i, i+1\},
\]

\[
x_{i+1}u_i - u_ix_{i+1} = \tau_{i,i+1},
\]

\[
u_ix_{i+1} - x_{i+1}u_i = \tau_{i+1,i}.
\]

The parities of elements in nilHecke$_n(A)$ are induced from those of Pol$_n(A)$ and nilCox$_n$. The Frobenius nilCoxeter algebra nilCox$_n(A)$ is the subalgebra of nilHecke$_n(A)$ generated by the $u_i$'s and all the elements $a \in A^\otimes n$.

**Remark 3.4.** If $A$ has a $\mathbb{Z}$-grading, then we can endow nilHecke$_n(A)$ with a $\mathbb{Z}$-grading by defining $|a_i| = |a|$ for $a \in A$, $|x_i| = 1$ and $|u_i| = 0$.

**Proposition 3.5.** The superalgebra nilHecke$_n(A)$ is independent of the trace map $tr$.

**Proof.** Suppose we have two Frobenius superalgebras $(A, tr_1)$ and $(A, tr_2)$ with trace map parities $\varepsilon_1$ and $\varepsilon_2$ whose underlying superalgebra is the same. Below, $v \in A$ is the unique element described in Remark 2.3.

\[
tr_1(b_i^{\varepsilon_1}b_j) = \delta_{i,j} = tr_2(b_i^{\varepsilon_2}b_j) = tr_1(b_i^{\varepsilon_2}b_j v).
\]

Therefore by uniqueness of dual basis elements, we have $(bv)^{\varepsilon_1} = b^{\varepsilon_2}$ where $b^{\varepsilon,i}$ is the dual basis element of $b$ with respect to $tr_1$. By Proposition 3.2, we have

\[
\tau_{i,j}(v) = \sum_{b \in B} (-1)^{\varepsilon_1 + \varepsilon_2} b^{\varepsilon_2}_i b_j^{\varepsilon_1} v,
\]

where $\tau_{i,j}$ is $\tau_{i,j}$ defined with respect to $tr_k$. We will use the result $\tau_{i,j}(v) = (-1)^{\varepsilon_1 + \varepsilon_2} \tau_{i,j}(1) v$ to check that the map $\Gamma : nilHecke_n(A, tr_1) \to nilHecke_n(A, tr_2)$ given by

\[
x_i \mapsto (-1)^{\varepsilon_1 + \varepsilon_2} x_i, \quad u_i \mapsto u_i,
\]

is well defined. Verifications of the relations from Definition 3.3 are straightforward computations left to the reader. Therefore $\Gamma$ is an algebra homomorphism. Next, $\Gamma$ is bijective since the inverse $\Gamma^{-1} : nilHecke_n(A, tr_2) \to nilHecke_n(A, tr_1)$ is defined by

\[
x_i \mapsto (-1)^{\varepsilon_1 + \varepsilon_2} x_i, \quad u_i \mapsto u_i.
\]

It is clear that $\Gamma \circ \Gamma^{-1}$ and $\Gamma^{-1} \circ \Gamma$ both act as the identity on generators. 

**Proposition 3.6.** For $1 \leq i, j < n$, $i \neq j$ we have

\[
\psi_j(\tau_{i,j}) = (-1)^{\varepsilon_j} \tau_{j,i}.
\]

**Proof.** We have

\[
\psi_j^{-1}(\tau_{j,i}) = \sum_{b \in B} (-1)^{\varepsilon_j} \psi_j^{-1}(b)_j b_i^{\varepsilon_j}.
\]

By Remark 3.1,
\[
\theta_{i,j} = \begin{cases} 
\varepsilon_{i,j} & \text{if } i < j, \\
\varepsilon_{i,j} & \text{if } i > j, \\
\varepsilon_{i,j} & \text{if } i = j.
\end{cases}
\]

where the third equality follows from \( \text{tr}((-1)^{\varepsilon_{i,j}}(b^{(i)})^{(j)}) = \text{tr}(b^{(i)}\psi^{-1}(b)) \). \( \square \)

\section{The Clifford nilHecke algebra}

In this section, we prove that by choosing the Clifford superalgebra \((A = \text{Cl})\), our Frobenius nilHecke algebra is Morita equivalent to the odd nilHecke algebra that can be found in [EKL14] by Ellis-Khovanov-Lauda. We also get a Morita equivalence of subalgebras \(\text{nilCox}_n(A)\) and the odd nilCoxeter algebra from [EKL14].

\begin{definition}[Odd nilHecke algebra]
Define \(\text{ONH}_n\) to be the super algebra generated by \(\Delta_i\) for \(1 \leq i < n\) and \(y_j\) for \(1 \leq j \leq n\) with the following relations:
\[
\begin{align*}
\Delta_i \Delta_{i+1} \Delta_i &= \Delta_{i+1} \Delta_i \Delta_{i+1}, \\
y_i y_j + y_j y_i &= 0 \quad (i \neq j), \\
y_i \Delta_j + \Delta_j y_i &= 0 \quad (i \neq j, j + 1), \\
\Delta_i^2 &= 0, \\
y_{i+1} \Delta_i + \Delta_i y_{i+1} &= 1, \\
\Delta_i y_{i+1} + y_{i+1} \Delta_i &= 1, \\
\Delta_i \Delta_j + \Delta_j \Delta_i &= 0 \quad (|i - j| > 1),
\end{align*}
\]
where we declare the \(y_i\) and \(\Delta_i\) to be odd. Define \(\text{ONC}_n\) to be the subalgebra generated by the \(\Delta_i\)'s. Note that this definition can also be found in Section 2.2 of [EKL14] by Ellis-Khovanov-Lauda.
\end{definition}

\begin{remark}
Define the Clifford superalgebra \(\text{Cl} \otimes \mathbb{k}\) over \(\mathbb{k}\) with one generator \(c\) where \(c^2 = 1\). We consider the odd trace map \(\text{tr} : \text{Cl} \rightarrow \mathbb{k}\) given by \(\text{tr}(a + bc) = b\) for \(a, b \in \mathbb{k}\). This means that we consider \(x_i\) to be odd in \(\text{nilHecke}_n(\text{Cl})\). The algebra \(\text{Cl}^{\otimes n}\) has generators \(c_i\) for \(1 \leq i \leq n\) and \(c_i^2 = 1\).
\end{remark}

\begin{theorem}
We have a superalgebra isomorphism \(\Phi : \text{nilHecke}_n(\text{Cl}) \rightarrow \text{Cl}^{\otimes n} \otimes \text{ONH}_n\) given by
\[
\begin{align*}
c_i &\mapsto c_i, \\
x_i &\mapsto y_i, \\
u_i &\mapsto (c_i - c_{i+1})\Delta_i.
\end{align*}
\end{theorem}

\begin{proof}
A straightforward computation verifies the relations from Definition 3.3. It is equally painless to check the relations from Definition 4.1 for the inverse map \(\Phi^{-1} : \text{Cl}^{\otimes n} \otimes \text{ONH}_n \rightarrow \text{nilHecke}_n(\text{Cl})\) given by
\[
\begin{align*}
c_i &\mapsto c_i, \\
y_i &\mapsto x_i, \\
\Delta_i &\mapsto \frac{1}{2}(c_i - c_{i+1})u_i.
\end{align*}
\]
Since \(\Phi\) and its inverse are both homomorphisms, \(\Phi\) is an isomorphism. \( \square \)
\end{proof}

\begin{corollary}
As superalgebras, \(\text{nilCox}_n(\text{Cl}) \cong \text{Cl}^{\otimes n} \otimes \text{ONC}_n\).
\end{corollary}

\begin{proof}
Restricting \(\Phi\) from Theorem 4.3 to \(\text{nilCox}_n(\text{Cl})\) gives the result. \( \square \)
\end{proof}

Analogous to Section 3.3 in [EKL14] by Ellis-Khovanov-Lauda, we will define the involution \(\sigma\) on \(\text{nilHecke}_n(A)\) given by
\[
\begin{align*}
\sigma(u_i) &= -u_{n-i}, \\
\sigma(x_i) &= x_{n-i+1}, \\
\sigma(a_i) &= a_{n-i+1}.
\end{align*}
\]
The relations of \(\text{nilHecke}_n(A)\) are straightforward to verify. For example,
\[
\sigma(x_{i+1} u_i - u_i x_i - \tau_{i,i+1}) = -x_{n-i} u_{n-i} + u_{n-i} x_{n-i+1} - \tau_{n-i+1,n-i} = 0.
\]
When working with string diagrams in a strict monoidal category like in [SS20], \(\sigma\) is the reflection of the diagram in the vertical axis. Next, we’ll see an anti-involution obtained by reflecting along the horizontal axis.

When \(A\) is symmetric, we define the anti-involution \(\Psi\) on \(\text{nilHecke}_n(A)\) given by
\[
\Psi(u_i) = (-1)^i u_i, \quad \Psi(x_i) = x_i, \quad \Psi(a_i) = a_i.
\]
Again, checking the relations is a painless verification:
\[
\Psi(x_i+1)u_i - u_i x_i = (-1)^i u_i x_i+1 - (-1)^i x_i u_i = (-1)^i \tau_{i+1,i} 3.6 = \Psi(\tau_{i+1,i}).
\]
Notice that \(\Psi\) acts as the identity on \(\text{Pol}_n(A)\) since \(A\) is symmetric. Also, we have \(\sigma \circ \Psi = \psi \circ \sigma\) since both sides act the same on generators and both are anti-automorphisms.

5. Frobenius Demazure operators

This chapter acts as a stepping stone to the basis theorem in the next chapter. We define the Frobenius Demazure operators and deduce relations that will be used to prove a faithful action. Along the way, we give some explicit formulas for the Frobenius Demazure operators as well.

**Definition 5.1.** For \(1 \leq i < n\), define the Demazure operator \(\partial_i : \text{Pol}_n(A) \to \text{Pol}_n(A)\) inductively
\[
\partial_i(x_i) = -\tau_{i,i+1}, \quad \partial_i(x_{i+1}) = \tau_{i+1,i}, \quad \partial_i(x_j) = 0 \quad (|i - j| > 1), \quad \partial_i(a) = 0 \quad (a \in A^{\otimes n}),
\]
and we extend \(k\)-linearly. Next, we define \(\partial_i\) on all of \(\text{Pol}_n(A)\) by
\[
\partial_i(fg) = \partial_i(f)g + s_i(f)\partial_i(g) \quad f, g \in \text{Pol}_n(A),
\]
where the \(s_i \in S_n\) act by superpermutations.

**Remark 5.2.** To see that \(\partial_i\) is well-defined, start with the same definition of \(\partial_i\) but change the domain to the associative algebra \(F\): the free product of \(A^{\otimes n}\) and the non-commuting variables \(x_1, \ldots, x_n\). Clearly this map is well-defined since
\[
\partial_i(f(gh)) = \partial_i(f)gh + s_i(f)\partial_i(gh)
\]
\[
= \partial_i(f)gh + s_i(f)\partial_i(g)h + s_i(f)s_i(g)\partial_i(h)
\]
\[
= \partial_i(fg)h + s_i(fg)\partial_i(h) = \partial_i((fg)h).
\]
Next, if \(r \in F\) is one of the relations from Definition 3.1, we have
\[
\partial_i(fr) = \partial_i(f)r + s_i(f)\partial_i(r)g + s_i(f)s_i(r)\partial_i(g) = 0,
\]
since \(r = 0 = s_i(r)\) in \(\text{Pol}_n(A)\) and \(\partial_i(r) = 0\) by simple verifications using Lemmas 3.3.2 and 3.3.4 from [Men20] by Mendonca. Then \(\partial_i\) induces a map from \(F/J \cong \text{Pol}_n(A)\) where \(J\) is the ideal generated by the relations from Definition 3.1.

**Proposition 5.3.** In \(\text{End}_k(\text{Pol}_n(A))\), we have the following relations:
\[
\partial_i s_i = -s_i \partial_i, \quad \partial_i s_j = s_j \partial_i \quad (|i - j| > 1),
\]

(5.1)
\[
\partial_i^2 = 0, \quad \partial_i \partial_j = \partial_j \partial_i \quad (|i - j| > 1).
\]

(5.2)

**Proof.** We first show that \(\partial_i s_i(f) = -s_i \partial_i(f)\) and \(\partial_i s_j(f) = s_j \partial_i(f)\) for \(|i - j| > 1\) by induction. Both equations are clearly true on the generators \(x_i, x_{i+1}, x_k, a\). Assume both are true for \(f, g \in \text{Pol}_n(A)\).
\[
\partial_i(s_i(fg)) = \partial_i(s_i(f)s_i(g) + s_i^2(f)\partial_i(s_i(g)) = -s_i \partial_i(f)s_i(g) - s_i^2(f)\partial_i(g) = -s_i \partial_i(fg),
\]
\[
\partial_i(s_j(fg)) = \partial_i(s_j(f)s_j(g) + s_j^2(f)\partial_j(s_j(g)) = s_j \partial_i(f)s_j(g) + s_j s_i(f)s_j(\partial_i(g) = s_j \partial_i(fg).
\]
This completes the proofs of equations (5.1). Next, we also prove (5.2) by induction. We have
\[
\partial_i^2(f) = \partial_i \partial_j(f) = \partial_j \partial_i(f) = 0 \quad (|i - j| > 1),
\]
for \(f \in \{x_i, x_{i+1}, x_k, a\}\), so the base cases are satisfied. For induction, we have
\[
\partial_i \partial_i(fg) = \partial_i(\partial_i(fg) + s_i(f)\partial_i(g)) = \partial_i^2(fg) + s_i \partial_i(f)\partial_i(g) + \partial_i s_i(f)\partial_i(g) + s_i^2(f)\partial_i^2(g) = 0
\]
\[
\partial_i \partial_j(fg) = \partial_i(\partial_j(fg) + s_j(f)\partial_j(g)) = \partial_i \partial_j(fg) + s_i \partial_j(f)\partial_j(g) + \partial_i s_j(f)\partial_j(g) + s_i s_j(f)\partial_i \partial_j(g)
\]
Now for induction, we have
\[(5.5)\]

This completes the demonstration.

Proposition 5.4. In $\text{End}_A(\text{Pol}_n(A))$, we have the following relations:
\[
\begin{align*}
(5.3) & \quad s_is_{i+1} \partial_i = \partial_{i+1}s_is_{i+1}, & \partial_is_{i+1}s_i = s_is_{i+1}\partial_{i+1}, \\
(5.4) & \quad \partial_i\partial_{i+1}s_i + s_i\partial_{i+1}\partial_i = \partial_{i+1}s_i\partial_{i+1}, & \partial_{i+1}\partial_i\partial_{i+1} + s_{i+1}\partial_i\partial_{i+1} = \partial_is_{i+1}\partial_i, \\
(5.5) & \quad \partial_i\partial_{i+1}s_i = \partial_{i+1}s_i\partial_i. 
\end{align*}
\]

Proof. We prove $s_is_{i+1}\partial_i = \partial_{i+1}s_is_{i+1}$ by induction. It is simple to verify equality for $f \in \{x_i, x_{i+1}, x_k, a\}$. Now for induction, we have
\[
\begin{align*}
\partial_is_is_{i+1}\partial_i(fg) &= s_is_{i+1}\partial_i(f)s_is_{i+1}(g) + s_is_{i+1}(f)s_is_{i+1}\partial_i(g) \\
&= \partial_{i+1}s_is_{i+1}(f)s_is_{i+1}(g) + s_is_{i+1}(f)\partial_{i+1}s_is_{i+1}(g) \\
&= \partial_{i+1}(s_is_{i+1}(f)s_is_{i+1}(g)) = \partial_{i+1}s_is_{i+1}(fg).
\end{align*}
\]

We multiply both sides by $s_is_i$ to obtain our next result:
\[
\partial_is_is_{i+1}\partial_i = \partial_is_is_{i+1} \Rightarrow \partial_is_is_{i+1} = \partial_is_is_{i+1} = \partial_is_is_{i+1}\partial_i.
\]

For the induction, we have
\[
\begin{align*}
\partial_i\partial_{i+1}s_i + s_i\partial_{i+1}\partial_i &= \partial_{i+1}s_is_{i+1} + s_i\partial_{i+1}\partial_{i+1}s_i \\
\partial_{i+1}\partial_is_is_{i+1} &= \partial_is_is_{i+1} + s_is_{i+1}\partial_{i+1}s_i \\
\partial_{i+1}\partial_is_{i+1}\partial_i &= \partial_is_{i+1}\partial_{i+1}\partial_i \\
\partial_{i+1}\partial_is_{i+1}\partial_i &\Rightarrow \partial_is_{i+1}\partial_{i+1}\partial_i = \partial_is_{i+1}\partial_{i+1}\partial_i.
\end{align*}
\]

Finally we check the braid relation $\partial_i\partial_{i+1}\partial_i = \partial_{i+1}\partial_i\partial_{i+1}$. It is zero on all the generators, and we have
\[
\begin{align*}
\partial_is_is_{i+1}\partial_i = \partial_is_is_{i+1}(s_i(h)\partial_i+h(g)h) \\
&= \partial_i(s_is_{i+1}(s_i(g)\partial_i)+\partial_i(h)+s_is_{i+1}(g)\partial_i) + s_is_{i+1}(g)\partial_i\partial_i + s_i\partial_is_{i+1}(g)\partial_i, \\
&= s_is_{i+1}(g)\partial_i\partial_i + s_i\partial_is_{i+1}(g)\partial_i + s_is_{i+1}(g)\partial_i, \\
&= s_is_{i+1}(g)\partial_i\partial_i + s_i\partial_is_{i+1}(g)\partial_i + s_is_{i+1}(g)\partial_i + s_i\partial_is_{i+1}(g)\partial_i, \\
&= s_is_{i+1}(g)\partial_i\partial_i + s_i\partial_is_{i+1}(g)\partial_i + s_is_{i+1}(g)\partial_i + s_i\partial_is_{i+1}(g)\partial_i, \\
&= s_is_{i+1}(g)\partial_i\partial_i + s_i\partial_is_{i+1}(g)\partial_i + s_is_{i+1}(g)\partial_i + s_i\partial_is_{i+1}(g)\partial_i.
\end{align*}
\]

This completes the demonstration.

Proposition 5.5. In $\text{End}_A(\text{Pol}_n(A))$, we have the following relations:
\[
\begin{align*}
(5.6) & \quad s_i(a)\partial_i = \partial_i(a), & x_j\partial_i = \partial_i(x_j) \quad (j \neq i, i+1), \\
(5.7) & \quad x_{i+1}\partial_i - \partial_ix_i = \tau_{i,i+1}, & \partial_ix_{i+1} - x_i\partial_i = \tau_{i+1,i}.
\end{align*}
\]
Proof. We verify these statements by direct computation.

**Proposition 5.6.** In \( \text{End}(\text{Pol}_n(A)) \), the following relations hold:
\[
\partial_i x_i x_{i+1} = x_i x_{i+1} \partial_i, \quad \partial_i x_{i+1} x_i = x_{i+1} x_i \partial_i.
\]

*Proof.* For any \( f \in \text{Pol}_n(A) \), we get
\[
\partial_i (x_i x_{i+1} f) = \partial_i (x_i x_{i+1}) f + s_i(x_i x_{i+1}) \partial_i (f) = -x_{i+1} x_i \partial_i (f) = x_i x_{i+1} \partial_i (f),
\]
and \( \partial_i x_{i+1} x_i = x_{i+1} x_i \partial_i \) follows since \( x_i x_{i+1} = -x_{i+1} x_i \).

**Definition 5.7** (Symmetric). A Frobenius superalgebra \( (A, \text{tr}) \) is symmetric when \( \text{tr}(ab) = (-1)^{\bar{a} \bar{b}} \text{tr}(ba) \) \( \forall a, b \in A \).

**Proposition 5.8.** If \( A \) is symmetric, then
\[
\partial_i (x_i^a) = -\tau_{i,i+1} \sum_{k=0}^{n-1} (-1)^k x_{i+1} x_i^{a-k+1}
\]
and
\[
\partial_i (x_{i+1}^b) = \tau_{i+1,i} \sum_{k=0}^{b-1} (-1)^k x_{i+1}^{b-k+1} x_i.
\]

*Proof.* The results follow by an induction on \( a \) and \( b \).

**Proposition 5.9.** If \( A \) is symmetric and the trace map is even, then we have
\[
\partial_i (ap) = s_i(a) \tau_{i,i+1} \frac{p - s_i(p)}{x_{i+1} - x_i},
\]
where \( a \in A^{\otimes n} \) and \( p \in \mathbb{k}[x_1, \ldots, x_n] \).

*Proof.* The result follows by induction on the degree of the polynomial.

6. Basis Theorem for an Arbitrary Frobenius Superalgebra

The Frobenius Demazure operators that we defined in the last chapter have the appropriate behavior to give us a faithful action on \( \text{Pol}_n(A) \otimes \text{nilCox}_n(A) \). We use this to prove injectivity for the basis theorem for \( \text{nilHecke}_n(A) \), along with a filtration argument to prove surjectivity. We also obtain a basis for the subalgebra \( \text{nilCox}_n(A) \).

**Definition 6.1.** For \( \alpha \in \mathbb{N}^n \), denote \( x^\alpha := x_1^{\alpha_1} \cdots x_n^{\alpha_n} \). Next, for \( w \in S_n \), denote \( \partial_w := \partial_{a_1} \cdots \partial_{a_k} \) where \( w = s_{a_1} \cdots s_{a_k} \) in reduced form. Note that \( \partial_w \) is well-defined since \( \partial_i \partial_j = \partial_j \partial_i \) and \( \partial_i \partial_{i+1} \partial_i = \partial_{i+1} \partial_i \partial_{i+1} \) when \( |i - j| > 1 \). Likewise, define \( u_w := u_{a_1} \cdots u_{a_k} \). We choose \( \partial_1 = \text{id}_{\text{Pol}_n(A)} \).

**Theorem 6.2.** \( \text{nilHecke}_n(A) \) acts on \( \text{Pol}_n(A) \otimes \text{nilCox}_n \) by
\[
f \cdot (g \otimes u_w) := fg \otimes \partial_w \quad (f \in \text{Pol}_n(A)),
\]
\[
u_i \cdot (g \otimes u_w) := s_i(g) \otimes u_i u_w + \partial_i (g) \otimes u_w,
\]
extended by \( \mathbb{k} \)-linearity.

*Proof.* To ensure that this action is well defined, we must check that it satisfies the relations of \( \text{nilHecke}_n(A) \). If we denote \( g \otimes u_w \) by \( g u_w \), then the proofs of relations (3.3)—(3.5) are nearly identical to the inductive steps in Propositions 5.3 and 5.4. Finally, using Proposition 5.5, we verify the remaining relations, namely (3.6)—(3.9):
This completes the proof.

Definition 6.3 (Filtration). Denoting the free product of $\text{Pol}_n(A)$ and $\text{nilCox}_n$ as $F$, we get a quotient map $\phi : F \to \text{nilHecke}_n(A)$ given by the quotient of the relations (3.6)–(3.9). In $F$, we define $\deg(x_i) = 1$, $\deg(u_i) = 0$, and the degree of a product to be the sum of the degrees. This gives us a decomposition $F = \bigoplus_{r=0}^{\infty} F_r$, where $F_r$ is the set of elements of $F$ of degree $r$. For each $k$, define $\text{nilHecke}_n(A)_{\leq k} := \phi(\bigoplus_{r=0}^{k} F_r)$.

Remark 6.4. The relations $x_i x_j = (-1)^{i} x_j x_i$ and $a x_i = (-1)^{i} a x_i \psi(a)$ in $\text{Pol}_n(A)$ imply that every element is equal to a sum of terms of the form $ax^{\alpha}$ where $\alpha \in \mathbb{N}^n$. This is used in the following basis theorem.

Theorem 6.5 (Basis Theorem). The map

$$\Phi : \text{Pol}_n(A) \otimes \text{nilCox}_n \to \text{nilHecke}_n(A), \Phi(g \otimes u_w) = gu_w,$$

is an isomorphism of vector spaces.

Proof. Let

$$B_1 = \{ax^{\alpha} \otimes u_w \mid a \in B_{\infty n}, \alpha \in \mathbb{N}^n, w \in S_n \} \subseteq \text{Pol}_n(A) \otimes \text{nilCox}_n,$$

where $B$ is a basis for $A$. Therefore $B_1$ is a basis for $\text{Pol}_n(A) \otimes \text{nilCox}_n$ since $\{u_w \mid w \in S_n \}$ is a basis for $\text{nilCox}_n$, described in Section 2 of [FS94] by Fomin and Stanley. We will prove that $\Phi$ is surjective by induction on the filtration of $\text{nilHecke}_n(A)$ from Definition 6.3. First, we have $\text{nilHecke}_n(A)_{\leq 0} \subseteq \text{Im}(\Phi)$ since any polynomial with only generators $u_i$ and elements from $A^{\infty n}$ is equal to a sum of elements of the form $au_w$ since we have $u_i a = s_i(a) u_i$. Next, assume $\text{nilHecke}_n(A)_{\leq r} \subseteq \text{Im}(\Phi)$ for some $r \in \mathbb{N}$. We wish to show that $\text{nilHecke}_n(A)_{\leq (r+1)} \subseteq \text{Im}(\Phi)$. Suppose we have an element $f_1 z_1 f_2 z_2 \cdots f_k z_k \in \text{nilHecke}_n(A)_{\leq (r+1)}$, for some $k \in \mathbb{N}$ with $f_i$ in $\text{Pol}_n(A)$ and $z_i \in \text{nilCox}_n$. Then each variable can be moved over to the left using relations (3.7)–(3.9). When $ux_i x_i + \tau_i u_i$ or $u_i x_i = x_i + u_i - \tau_i u_i$ are used, then the second term containing $\tau_i u_i$ will be in $\text{nilHecke}_n(A)_{\leq r}$, so by the induction hypothesis, it is in $\text{Im}(\Phi)$. As for the leading term, once all the variables are on the left, then it is clearly in $\text{Im}(\Phi)$. Since $\text{Im}(\Phi)$ is closed under addition, the sum of all the terms, each of which we’ve shown to be in $\text{Im}(\Phi)$, is in $\text{Im}(\Phi)$. This completes the induction, so $\Phi$ is surjective.

Next, let $1_C$ denote $1_{\text{nilCox}_n}$. Since we have $\partial_i ((1_A^{\infty n}) = 0 \forall i$, we get

$$ax^{\alpha} u_w ((1_A^{\infty n}) \otimes 1_C) = ax^{\alpha} (w(1_A^{\infty n}) \otimes u_w 1_C) = ax^{\alpha} (1_A^{\infty n} \otimes u_w) = ax^{\alpha} \otimes u_w.$$ 

Therefore the map $u : \text{nilHecke}_n(A) \to \text{Pol}_n(A) \otimes \text{nilCox}_n$ defined by $u(w) = w \cdot ((1_A^{\infty n}) \otimes 1_C)$ is left inverse of $\Phi$ since $u \circ \Phi = \text{id}_{\text{Pol}_n(A) \otimes \text{nilCox}_n}$. This means that $\Phi$ is injective, so we have an isomorphism as desired, and conclude that $\Phi(B_1)$ is a basis for $\text{nilHecke}_n(A)$.

Corollary 6.6. We have a basis $\{au_w \mid w \in S_n, a \in A^{\infty n} \}$ for $\text{nilCox}_n(A)$ as a vector space.

Proof. It is clearly spanning since we have the relation $s_i(a) u_i = u_i a$. Linear independence follows from the inclusion map $\text{nilCox}_n(A) \to \text{nilHecke}_n(A)$ and Theorem 6.5. □
